

Animals extinction

We have global problem of the world, it is animals extinction. Animals like blue whales, white tigers, giant pandas, Asian elephants, snow leopards are endangered. Some reasons of this:

1. Environmental changes (air and water pollution)
2. Animal hunting
3. Climate changes

Animals are very important for our environment, we can be the cause of ecological disaster. That's why we should do everything what we can to protect them.

Air Pollution is a serious environment problem. If we consider environment problems one of the most important is air pollution. What pollutes our air? Air pollution is caused by many reasons, and all sources can be divided into natural or natural, and artificial. You should start with the first group. Which includes pollutants generated by nature itself: the first source is volcanoes. And is ejected out, they throw a huge number of small particles of different roots. It is worth noting such as peat or forest fires.

We all deserve a place
We can all our home
Food is a treasure from the soil
and the sea
Clean, fresh air from the plants
and the trees.

Water pollution

Water pollution occurs mainly when people overload the water environment such as streams lakes underground water, bays or soil with wastes or substances harmful to living beings.

Pollutants can be separated into several different classes:

The first class is petroleum products, oil, fuel, lubrication, plastics.

The second class is pesticides and herbicides.

The third class are heavy metals, such as, mercury, selenium, uranium, radium, cesium, etc.

The fourth class is fertilizers and other nutrients used to promote plant growth on farms and in gardens.

The fifth class is infectious organisms and pathogens.

The last one is thermal pollution.
Do not pollute the environment!
